

# Orange Shellac (unbleached)

## Processing

### Executive Summary

Shellac is derived from the hardened secretion of the lac insect, *Laccifer (Tachardia) lacca*. These are scale-like insects feeding on resiniferous trees and bushes cultivated in India and southeast Asia. The resin is secreted as a covering for the insect larvae. The lac is collected from host trees by cutting branches containing resinous insects, and grinding and further processing. Processing involves various steps, including melting, screening, filtering, and can involve solvent extraction and de-colorising with activated charcoal.

The petitioned use is as a component of fruit and vegetable coatings, and as a coating agent for pharmaceuticals and confectionery products. The purpose cited is for forming a film on the coated product, improving cosmetic appearance, and providing moisture and atmospheric protection.

The NOSB considered shellac as part of a Technical Advisory Panel review for Waxes in September, 1999. The NOSB voted that shellac was synthetic, and recommended not to add it to the National List. The review at that time did not distinguish between bleached or unbleached forms of shellac. The TAP reviewers found that orange unbleached shellac is derived from natural sources, though one considered that the materials used in manufacturing rendered the substance synthetic and not compatible with organic standards. A second reviewer found that the uses of the material to extend shelf life, reduce water loss, and improve cosmetic appeal are not compatible with organic principles. The third reviewer found the material suitable for organic use, though expressed some concerns that consumers should be informed that products have shellac coatings applied, especially since there are some reports of allergenicity.

The NOSB may want to investigate further if confectionery use is warranted, as this review does not examine this use in depth. The NOSB may also want to investigate possible options for labeling or otherwise identifying produce that contains coatings when sold at retail level.

### Summary of TAP Reviewer Analysis<sup>1</sup>

#### 95% organic

Synthetic / Non-Synthetic:	Allowed or Prohibited:	Suggested Annotation:
Synthetic – 1 Non synthetic -2	Allow – 1, with annotation Prohibit – 2	For use as fruit coatings only

#### Made with organic (70% or more organic ingredients)

Synthetic / Non-Synthetic:	Allowed or Prohibited:	Suggested Annotation:
Synthetic – 1 Non synthetic -2	Allow- 3 2- no annotation 1 – with annotation	Allowed only when labeled to indicate that a coating has been added

### Identification

36  
37 **Chemical Names:** 39  
38 Shellac 40 **Other Name:**

<sup>1</sup> This Technical Advisory Panel (TAP) review is based on the information available as of the date of this review. This review addresses the requirements of the Organic Foods Production Act to the best of the investigator's ability, and has been reviewed by experts on the TAP. The substance is evaluated against the criteria found in section 2119(m) of the OFPA [7 USC 6517(m)]. The information and advice presented to the NOSB is based on the technical evaluation against that criteria, and does not incorporate commercial availability, socio-economic impact, or other factors that the NOSB and the USDA may want to consider in making decisions.

41	Lacca, lac. Unbleached shellac. Forms in commerce are	47	Formulations containing shellac: Shield-Brite, Fresh-

54  
55  
56  
57

## 58 **Characterization**

### 59 **Composition:**

60 A mixture of resins secreted by the lac insect. The resins are composed of a complex mixture of aliphatic and alicyclic hydroxy  
61 acids and their polyesters (Budavari, 1996, Martin 1991). Components include aleuritic acid, shelloic cid, jalaric acid, and other  
62 compounds. A dye called laccaic acid is associated with the crude lac, and removed by processing.

63 The insect also secretes a thin white filamentous wax along with the lac resins, this may be removed also in processing.

64  
65  
66  
67  
68  
69

### 65 **Properties:**

66 Shellac is hard, tough, amorphous resin that has good water resistance and produces high lustrous finishes. Soluble in  
67 alcohols, aqueous solutions of alkali, organic acids and ketones, but insoluble in water (Martin, 1991, Budavari 1989).

68 Forms include brittle, yellowish, transparent sheets or crushed pieces, flakes or powder (Budavari, 1989).

69  
70

### 70 **How Made:**

71 Shellac is derived from the hardened secretion of the lac insect, *Laccifer* (Tachardia) *lacca* Kerr (order Homoptera, family  
72 Coccidea), also known as *Kerria lacca* (Kerr). These are scale-like insects feeding on resiniferous trees and bushes cultivated in  
73 India, Burma, Thailand, Laos, Cambodia and Vietnam. The resin is secreted as a covering for the insect larvae. The insects are  
74 collected from host trees by cutting branches containing young insects prior to a swarming stage. These branches are tied to new  
75 trees, where young larvae emerge and colonize young twigs, continually secreting resin.

76  
77  
78  
79  
80  
81  
82  
83  
84  
85

77 The resulting product is called seed lac, and is further processed in a variety of methods to yield different products. These are  
78 classed as handmade, machine –made, and bleached shellacs. Although some is processed by hand, most commercial shellac is  
79 machine made using either a heat or solvent process. The heat process involves melting the seed lac, and filtering under pressure  
80 through screens to produce standard grades of orange shellac (Martin 1982, Class 1991). The solvent process can either produce  
81 wax-containing, dewaxed or dewaxed-decolorised shellac. This involves dissolving the seed lac in ethyl alcohol, heating and  
82 filtering to remove impurities, then dehydrating and flaking. Dewaxed forms are produced by additional filtration presses prior to  
83 flaking. Decolorised forms are produced by treating with activated carbon after dewaxing. (Martin, 1982) This is the process  
84 described by the petitioner (Singhana, 2001).

86  
87  
88  
89

86 Bleached shellacs are produced by dissolving seed lac in aqueous sodium carbonate at high temperature, centrifuging and filtering,  
87 and treatment with sodium hypochlorite. The solution is then acidified with sulfuric acid to precipitate the resin, which is further  
88 filtered, washed and dried. Wax free or wax containing grades may be produced, depending on additional filtration steps (Martin,  
89 1982).

90  
91

### 91 **Specific Uses:**

92 In food shellac is used as a coating agent, color diluent, surface finishing agent, glazing/polishing agent, and used in  
93 confectionery, food supplement tablets, as well as chewing gum. Additional uses are as a component of adhesives for  
94 food contact, in packaging, inks, pharmaceutical coatings, cosmetics, lacquers and varnishes for wood, floor polish,  
95 manufacture of buttons, stiffening of hats, finishing of leather (Budavari, 1996; Ash 1995; Martin 1982).

96  
97

### 97 **Action:**

98 Shellac is used as an ingredient in edible fruit coatings to limit water loss and prevent dessication and weight loss, and  
99 prevent entry of pathogens. Shellac coatings are fairly impermeable to oxygen and water, and form a barrier on the fruit  
100 surface that reduces gas exchange. Reduction in oxygen levels will reduce the rate of respiration of fruits and vegetables  
101 and prolong shelf life by delaying the oxidative breakdown of the product. This also causes reduced production of  
102 ethylene; which normally triggers further maturation and ripening. Shellac waxes are also added to provide high-gloss  
103 finishes to fruit for cosmetic purposes (FDA 2001; Hagenmeier 2000; Kaplan, 1986).

104  
105

### 105 **Combinations:**

106 Shellac is applied in combination with other ingredients when used in fruit and vegetable coatings. Many different  
 107 formulations of coatings have been investigated and developed to provide different degrees of gas and water permeability.  
 108 According to the petitioner, shellac content can range from 2-45%. Other ingredients that may be used include carnauba  
 109 wax, wood resins, polyethylene emulsions, paraffin wax, petroleum wax, candelilla wax, oleic acid, lauric acid, stearic acid,  
 110 palmitic acid, morpholine (as fungicide and plasticizer), ammonia, potassium hydroxide, oils, alcohol, glycerol. (FDA,  
 111 2001; Hagenmeier 1994; Sankaranarayanan, 1989, McGuire 1999). Recent research on biocontrol of fruit rot has  
 112 demonstrated efficacy of replacing fungicidal materials and ammonia with various ingredients (sucrose esters, potassium  
 113 hydroxide, different surfactants) that support colonization of fruit surface by beneficial yeasts that are antagonist to blue  
 114 mold fungi (McGuire 1999).

115  
 116 Shellac used for confectionery glazing and pharmaceutical tablets may be dissolved in a solvent, usually ethanol but  
 117 sometimes isopropyl alcohol is used. Shellac may also be dissolved in alkaline solutions such as sodium carbonate, borax,  
 118 ammonia and in some instances morpholine or triethanolamine. Synthetic plasticisers, preservatives such as phenol, or the  
 119 mixed methyl and propyl esters of p-hydroxybenzoic acid and anti-foam agents may also be added (Sankaranarayanan,  
 120 1989).

121

## 122 **Status**

### 123 **Historic Use:**

124 Lac has been used in India for several thousand years, as a source of dye and decorative coatings. Records from the late  
 125 1500s Mogul ruler Akbar describe the use to decorate public buildings, as do writings of early Portuguese travelers (Martin,  
 126 1982). The Chinese applied molten waxes to oranges and lemons as early as the twelfth or thirteenth century. Ancient  
 127 Greek and Roman writers were aware of it, and it became widely used in Europe for furniture finishes by the late fifteenth  
 128 century. (Class, 1991) In the US, waxes used on citrus initially were paraffin based in the 1930's, evolving to solvent based  
 129 resins in the late 1940's. Carnauba waxes became popular in the late 1950's but were less popular due to lack of shine.  
 130 Waxes containing shellac and various alkali soluble resins plus adjuvants were introduced in the early 1960s, and have been  
 131 widely used in citrus producing areas. (Kaplan, 1986)

132  
 133 For organic use, natural waxes have been used in packing citrus fruits, particularly for export. Use in post-harvest handling  
 134 of organic pome fruits and fruit vegetables such as cucumbers, summer squash and bell peppers is a relatively recent  
 135 phenomenon. Some certifiers have at various times had a restricted application only to 'non-edible plant parts' with the  
 136 implicit allowance for citrus but no other uses.

137

138

### 139 **OFPA, USDA Final Rule:**

140 Shellac is not listed in OFPA or 7 CFR part 205. Unbleached shellac could be considered non-synthetic, used in handling,  
 141 and not organically produced under OFPA 6517(c)(1)(B)(iii).

142

### 143 **Regulatory: EPA/NIEHS/Other Sources**

144 Not listed in the NIEHS National Toxicology Program database.

145 As a non-active ingredient in pesticides, EPA lists shellac on List 3 - Inerts of unknown toxicity (EPA, 2001).

146

147 Although the petition and literature from a shellac trade group claim that shellac is listed by FDA as GRAS (Singhania  
 148 2001, Sankaranarayanan 1989), review of FDA database did not confirm this. (EAFUS 2002) A proposed notice of GRAS  
 149 affirmed status was filed in 1989,(FDA 1989) but GRAS status was not officially granted. The proposed notice states that  
 150 FDA had issued a letters of opinion that the substance is GRAS for use in candy coatings, that predated the 1958 Food  
 151 Additives Act, which would give it "prior sanction" status. However shellac is not listed in the CFR as either GRAS, prior  
 152 approved GRAS or in the newer database of recently affirmed GRAS substances (FDA 2002).

153

154 Regulated uses include:

155

<u>CFR listing</u>	<u>Use</u>
21 CFR 73.1	Diluents in color additive mixtures for food use exempt from certification
21 CFR 101.4 (b)(22)	Food Labeling-- 101.4 Food; designation of ingredients.
21 CFR175.105	Adhesives.
21CFR 175.300	Resinous and polymeric coatings
21 CFR 175. 380	Xylene –formaldehyde resins condensed with 4, 4'-isoprpylidenedip (allows material listed in 175.300)
21CFR175.390	Zinc-silicon dioxide matrix coatings. (allows material listed in 175.300)

27CFR 21.127	Alcohol, Tobacco Products And Firearms, Formulas For Denatured Alcohol And Rum— Subpart E--Specifications for Denaturants: Shellac (refined).
--------------	--

156  
157 Waxes used on fresh produce are considered ingredients by FDA and are required to be labeled as follows:  
158 21 CFR 101.4:(b) The name of an ingredient shall be a specific name and not a collective (generic) name, except that:  
159 (22) Wax and resin ingredients on fresh produce when such produce is held for retail sale, or when held for other than  
160 retail sale by packers or repackers shall be declared collectively by the phrase “coated with food-grade animal-based wax,  
161 to maintain freshness” or the phrase “coated with food-grade vegetable-, petroleum-, beeswax-, and/or shellac-based wax  
162 or resin, to maintain freshness” as appropriate. The terms “food-grade” and “to maintain freshness” are optional. The  
163 term lac-resin may be substituted for the term shellac.  
164

### 165 Status Among U.S. Certifiers

166 The NOSB considered shellac as part of a Technical Advisory Panel review for Waxes in September, 1999 (NOSB 1999).  
167 The NOSB voted that shellac was synthetic, and recommended not to add it to the National List. The review at that time  
168 did not distinguish between bleached or unbleached forms of shellac. Subsequently many certifiers included shellac as a  
169 prohibited material on their generic lists, as did OMRI. (OCIA 2001, CCOF 2000, OMRI 2001). Currently US certifiers  
170 have modified their standards to be compliant with the NOP National List, and since shellac is not included it is  
171 considered prohibited.  
172

### 173 International

174 CODEX – not listed

175 EU 2092/91 – not listed. The EU list only mentions carnauba and beeswax as releasing agents, not as food coatings.

176 IFOAM Basic Standards 2000 – not listed

177 Canada – not listed.

178 Japan –not listed  
179

## 180 Section 2119 OFPA U.S.C. 6518(m)(1-7) Criteria

- 181 1. *The potential of the substance for detrimental chemical interactions with other materials used in organic farming systems.*  
182 The material is used in processing, and does not have chemical interaction with farming systems.
- 183 2. *The toxicity and mode of action of the substance and of its breakdown products or any contaminants, and their persistence and areas of*  
184 *concentration in the environment.*  
185 This is considered in item 2 below.
- 186 3. *The probability of environmental contamination during manufacture, use, misuse, or disposal of the substance.*  
187 This is considered in item 2 below
- 188 4. *The effects of the substance on human health.*  
189 See items 3 and 5 below.
- 190 5. *The effects of the substance on biological and chemical interactions in the agroecosystem, including the physiological effects of the substance on*  
191 *soil organisms (including the salt index and solubility of the soil), crops and livestock.*  
192 The material is used in processing, and does not have interactions with farming systems. It is a natural material  
193 collected in a cultivated agricultural setting, generating income in a well-established cooperative market for tropical  
194 farmers. (Viswanath 1994, Kabra 1983)
- 195 6. *The alternatives to using the substance in terms of practices or other available materials.*  
196 See responses to number 1 and 7 below.
- 197 7. *Its compatibility with a system of sustainable agriculture.*  
198 See response to processing question number 6 below.  
199

## 200 Criteria From the February 10, 1999 NOSB Meeting

201  
202 A PROCESSING AID OR ADJUVANT may be used if:

- 203 1. *It cannot be produced from a natural source and has no organic ingredients as substitutes.*  
204 The lac resin is collected from a natural source, as described under “How Made.” The lac insects could be cultivated  
205 under organic management systems, however there appear to be no certified organic sources of production currently  
206 available. For some uses, organic beeswax could be a substitute, though this may not be commercially available in  
207 amounts needed. Other materials permitted on the National List (though not organic ingredients) that can be used in  
208 fruit coatings include carnauba wax, wood resins, glycerin, potassium hydroxide, and organic oils or fats. Water based  
209 whey protein isolate has potential to replace shellac or corn zein coatings for use in confectionery products (Trezza,  
210 2000).  
211

212 Fruit can be packed and stored without the use of shellac. Storage life can be extended through careful handling  
213 practices. Management of product storage environments through temperature and humidity control, and modified or

controlled atmosphere can extend storage life and prevent or delay the spread of infection of produce with pathogens. (FDA 2001). Citrus fruit has a natural layer of wax on the fruit surface, which can accumulate a residue of dirt, dust mold, spray residues, and sooty blotch (a blackish mold that grows in secretions deposited by aphids). This is usually washed off in the packing house using detergents or water and brushes. The washing removes the natural waxes and increases rind permeability. (Kaplan, 1986). Stricter grading, culling infected fruit, careful handling of produce during harvest and post-harvest to avoid physical damage, leaving the cuticle intact, reduced contact with excess foreign material, or contact with spoiled product, can also reduce the possibility of opportunistic infections. Fruit was once commonly wrapped in plain paper (Ayres, 1890). Planned management of product flow to satisfy shorter shelf life through multiple pickings and picking to order is another possibility. Biological control with antagonists such as *Candida oleophila* can also be part of an integrated system of post-harvest pathogen reduction (McGuire, 1999).

2. *Its manufacture, use, and disposal do not have adverse effects on the environment and are done in a manner compatible with organic handling as described in section 6510 of the OFPA.*

Manufacture of unbleached orange shellac using alkaline washing, heat, and mechanical filtration and use of activated charcoal to remove color does not appear to present any environmental adverse effects. Solvent extraction using alcohol or other solvents may pose recovery problems, which may be avoided when aqueous solutions are used. (Krause 2001, Trezza, 2000).

Bleached shellac manufacturing employs several additional extraction and refining steps that involve the use of strong acids, alkaline extractants, and oxidizing agents. Production and disposal of these synthetics may cause negative environmental consequences similar to that caused by other extracted materials.

Limited information was available about the effect of the lac harvest on the environment, though summaries of reports and description by the petitioner about collection practices support the claim that trees used for this purpose are repeatedly pruned and lopped to harvest the lac bugs. In some areas, tree species may serve multipurposes as fuel wood, fodder, construction materials and be intercropped with rice paddies. (Viswanath, 1994)

3. *If the nutritional quality of the food is maintained and the material itself or its breakdown products do not have adverse effects on human health as defined by applicable Federal regulations.*

The WHO/ FAO Joint Expert Committee on Food Additives (JECFA 1993) reviewed effects on health and the committee concluded that there were no toxicological concerns when used as coating, glazing, or surface finish agents applied externally to food. No information was available on long term carcinogenicity studies, however. Reproductive, teratogenicity (animal testing), and mutagenicity (bacterial) studies on showed no toxicological effects for bleached shellac. In humans, some allergies to shellac have been reported, including bronchial asthma and skin reactions from cosmetic products though other solvents may also be a factor. The FDA federal register notice of 1989 reported the findings of the Select Committee on GRAS Substances. They found that while no adverse effects had been reported for food uses of shellac over a long history, there was a lack of biological data regarding effects on animals or humans, and concluded they had insufficient data to recommend GRAS status. The possible effect of unsuspected contact of various components of fruit and vegetable coatings on sensitive individuals is a problem, as it is difficult to trace the use of food coatings that lack retail labeling (Frompovich, 1985).

While shellac coatings have long been known to improve storage life for some fruits, it is also widely reported that the impermeable coatings such as shellac and wood resin combinations result in lower internal oxygen, higher internal carbon dioxide, and a subsequent build up of ethanol under anaerobic conditions. This leads to off-flavor in citrus (Baldwin, 1995; Hagenmeier 2000; Hagenmaier 2002) and loss of volatile flavor components in apples as well as increased browning disorders in one variety of apple (Saftner 1999a, Saftner 1999b, Lau 1998). Extremely low oxygen levels that result in anaerobic conditions can favor growth of some food pathogens, such as *Clostridium*. Complete elimination of spoilage organisms is not considered to be a good idea, in that spoilage prevents pathogens from becoming a food safety issue. (FDA 2001) Formulations containing 10- 17% shellac were effective in killing larvae of Caribbean fruit fly in grapefruit (Hallman 1994). Shellac formulations with an alkaline base also reduced populations of coliform bacteria on citrus. (McGuire, 2001)

Research is very active in this area, and many different combinations and materials have been studied and proposed, many of which are not approved for organic handling. These include plasticizers such as polyethylene glycol, antimicrobials, and antioxidants. (FDA 2001). Different formulations of fruit coatings that have greater permeability have been proposed, including some that have less problems with flavor loss and those that encourage bio-control of pathogens (Hagenmaier 2002, McGuire 1999).

4. *Its primary purpose is not as a preservative or used only to recreate/improve flavors, colors, textures, or nutritive value lost during processing except in the latter case as required by law.*

274 The primary purpose of shellac when used in fruit or vegetable coatings is to reduce shrinkage due to water loss,  
 275 provide a barrier to free gas exchange in order to prolong shelf-life, and improve appearance by adding a shiny film. It  
 276 is also used as a base to provide carriers for decay controlling fungicides, or more recently for biocontrol agents used  
 277 to prevent decay (Kaplan, 1986, McGuire 1999). As a coating it is used also for supplements and vitamins as a  
 278 moisture barrier and is one of the few excipients allowed for this use. (Krause 2001) It does not replace nutrients or  
 279 improve flavors, but may act to reduce flavor in fruit coating formulations that are high in shellac (see above).  
 280 Prevention of fruit senescence and decay will preserve nutrients and freshness in crops handled in ways that reduce  
 281 the natural waxy coating. (Kaplan 1986)  
 282

- 283 5. *Is Generally Recognized As Safe (GRAS) by FDA when used in accordance with Good Manufacturing Practices (GMP), and contains*  
 284 *no residues of heavy metals or other contaminants in excess of FDA tolerances.*

285 As noted under the regulatory summary, shellac does not have GRAS status, though some uses may be considered  
 286 approved by prior sanction. The Food Chemicals Codex 4<sup>th</sup> Edition does not provide specific criteria for unbleached  
 287 shellac, and the Select Committee on GRAS noted in 1989 that there is a need to develop specifications for orange  
 288 shellac, and that it planned to work with the Committee on Food Chemicals Codex to develop them. Until that time,  
 289 the Select Committee proposed that orange shellac would be acceptable, provided it “is of appropriate food grade  
 290 purity in accordance with 21 CFR 184.1(b) and 170.30(h)(1).”  
 291

292 Food Chemical Codex requirements for Shellac, Bleached:

293 Acid Value: Between 73 and 89

294 Heavy metals (as Pb): Not more than 10 ppm

295 Loss on drying: Not more than 6%

296 Rosin: Passes test

297 Wax: Not more than 5.5%

298 Shellac, Bleached, Unwaxed

299 Acid Value: Between 75 and 91

300 Heavy metals (as Pb): Not more than 10 ppm

301 Loss on drying: Not more than 6%

302 Rosin: Passes test

303 Wax: Not more than 0.2%

- 304  
 305  
 306  
 307 6. *Its use is compatible with the principles of organic handling.*

308 The NOSB principles of organic handling state:

309 “Organic processors and handlers implement organic good manufacturing and handling practices in order to maintain the  
 310 integrity and quality of organic products through all stages of processing, handling, transport, and storage;  
 311 Organic processors and handlers use practices that minimize environmental degradation and consumption of non-renewable  
 312 resources. Efforts are made to reduce packaging; use recycled materials; use cultural and biological pest management  
 313 strategies; and minimize solid, liquid, and airborne emissions” (NOSB, 2001).  
 314

315 One could consider that if suitable fruit coatings can be developed using natural materials, it promotes quality and  
 316 integrity of organic products through all stages of transport and storage. Shellac is a renewable resource that provides  
 317 income to producers in developing countries and may encourage diversified agroforestry uses. Organic fruit often  
 318 requires washing to appear attractive in the market place due to less use of fungicides to control sooty blotch.  
 319

320 On the other hand, applied fruit coatings might not be needed if the natural cuticle of wax found on fruit was  
 321 maintained rather than scrubbed off during fruit cleaning at the packing shed. Shellac is a non-food materials that is  
 322 applied to food products in order to replace natural oils or waxes removed from fresh produce, or to otherwise  
 323 preserve produce in its harvested state for a longer than natural period of time. While arguments are made that these  
 324 materials are only applied to non-edible portions of fruit, such as the peel of citrus fruits, it is quite possible that these  
 325 parts of the fruit are also eaten. (Use of citrus peel in a variety of baked goods and other recipes is common.) As  
 326 such, it is safer to consider waxes as an ingredient. There is currently no mechanism in the marketplace for  
 327 consumers to know with certainty whether the product they buy is treated with wax, despite the fact that produce  
 328 must be labeled on its case as to any treatments. Were retailers of organic goods required, by certification or other  
 329 regulations, to clearly indicate when fresh produce has been treated with waxes, these materials might seem more  
 330 acceptable for use on certified organic produce.  
 331

332 Fruit wax serves to change cosmetic appearance and extend shelf life. The preservative action afforded by waxing of  
 333 fresh produce is a convenience, but is not a requirement of a sustainable system of agriculture, and may in some cases

334 be an encouragement of systems that are less sustainable, especially as it relates to long-distance transport of  
335 agricultural commodities.

336  
337 *7. There is no other way to produce a similar product without its use and it is used in the minimum quantity required to achieve the*  
338 *process.*

339 Alternatives are described in processing criteria number 1. Research into appropriate formulations appears to be very  
340 specifically targeted to develop optimal levels to produce desired effects on gas permeability. Over use of the shellac  
341 component in a fruit coating can lead to flavor and quality problems, so it is more likely that shellac would be used as  
342 one ingredient in a formulated wax coating.  
343

## 344 **TAP Reviewer Discussion**

345  
346 **Reviewer 1** [Ph.D. food science and nutrition, minor in biochemistry. Organic processing consultant, organic inspector, nutrition researcher.  
347 Western US]

### 348 **Comments on Database**

349 I find the database (Characterization and Status) to be reasonably complete and fairly accurate.

350 The technical information and research articles provided by OMRI were very comprehensive, as I could not find any  
351 additional references after conducting my usual computer literature search.  
352

353 Also, I would request the petitioner, RENSHELL, provide more detailed explanation of manufacturing methods to  
354 assist in the evaluation of organic handling compatibility.  
355

### 356 **NOSB Processing Criteria Evaluation**

357 1. *It cannot be produced from a natural source and has no organic ingredients as substitutes.*

358 I agree with the criteria evaluation

359 2. *Its manufacture, use, and disposal do not have adverse effects on the environment and are done in a manner compatible with organic*  
360 *handling as described in section 6513 of the OFPA.*

361 I agree with the criteria evaluation

362 3. *If the nutritional quality of the food is maintained and the material itself or its breakdown products do not have adverse effects on human*  
363 *health as defined by applicable Federal regulations.*

364 *The criteria evaluation needs to be corrected or amended as follows:*

365 There is no data from the literature showing any adverse effects of the use of beeswax on the nutritional quality of  
366 fresh fruits or vegetables.  
367

368 4. *Its primary purpose is not as a preservative or used only to recreate/improve flavors, colors, textures, or nutritive value lost during*  
369 *processing except in the latter case as required by law.*

370 *The criteria evaluation needs to be corrected or amended as follows:*

371 The primary purpose of using protective coatings is to reduce weight loss of products through transpiration  
372 mechanisms of water vapor during the storage and transportation of fresh agricultural commodities.  
373

374 5. *Is Generally Recognized As Safe (GRAS) by FDA when used in accordance with Good Manufacturing Practices (GMP), and contains*  
375 *no residues of heavy metals or other contaminants in excess of FDA tolerances.*

376 *The criteria evaluation needs to be corrected or amended as follows:*

377 According to the literature and information provided in the RENSHELL petition to the NOSB for the de-waxed  
378 flake shellac the major component is aleuritic acid which is 9,10,16-trihydroxy palmitic acid, a hydroxylated form of  
379 naturally occurring palmitic acid. Additionally, it is provided GRAS status by the FDA. According to 7CFR part  
380 205.605 both non-synthetic waxes and carnauba wax are allowed as ingredients labeled as organic.  
381

382 6. *Its use is compatible with the principles of organic handling*

383 *The criteria evaluation needs to be corrected or amended as follows:*

384 According to the RENSHELL petition documented on Annex 1, the preparation of the product from the Sticklac to  
385 the Seedlac phase appears to be compatible with organic process operations provided adequate pesticide residue  
386 analysis is conducted. The purification of Seedlac to the Dewaxed Flake Shellac step is problematic. The ethanol used  
387  
388  
389  
390  
391  
392

393 does not state if it is denatured (usually with another alcohol) or non-denatured as 100% ethanol and food grade  
394 which would significantly increase its cost due to BATF federal taxes.  
395

396 Additionally the question of ethanol production from fermentation needs further clarification as to the GMO status  
397 of the yeast and/or enzyme systems. Clarification of the product is conducted by activated charcoal which is not on  
398 the national list. Therefore the chemical evidence indicates that shellac is a synthetic final product as long as it is  
399 manufactured according to the process as described in Annex 1. However, if organic ethanol were to be used for  
400 purification with the Seedlac not subjected to final de-colorization, then a strong argument can be made for its  
401 compatibility with organic handling operations.  
402

- 403 7. *There is no other way to produce a similar product without its use and it is used in the minimum quantity required to achieve the process.*  
404 *The criteria evaluation needs to be corrected or amended as follows:*

405 Proposed methods to produce dewaxed flake shellac convert a natural polyester resin to a synthetic product  
406 [according to] the USDA-NOP rule as guideline. If the petitioner can document that no chemical change occurs in  
407 the Seedlac and purification is conducted in organic ethyl alcohol, then the process would be more compatible with  
408 organic systems. Overall, coatings are not essential for raw agricultural commodities, but only function to reduce  
409 weight loss (maintain a profit margin), enhance appearance (improve marketability at retail level) and provide a “fresh  
410 look” to the product. Usage levels generally are below 0.5% on a weight/weight basis.  
411

412 ***Conclusion – Summarize why this material should be allowed or prohibited for use in organic systems.***

413 I agree that impure shellac, also called Sticklac, appears to be a natural product that when further processed to  
414 Seedlac, minimal chemical modification has occurred. However, after treated with ethanol (I presume denatured due  
415 to the cost of pure food grade ethanol) and clarification with activated carbon which is not on the National List as  
416 documented in 7CFR-205.605, shellac is unquestionably synthetic. However, with modifications of its manufacturing  
417 operations with the use of organic ethyl alcohol and physical clarification with an approved processing aid, a strong  
418 argument can be made for its compatibility with organic handling operations.  
419

420 ***Reviewer 1 Recommendation Advised to the NOSB:***

421 *The substance is:* Synthetic  
422

423 In a product labeled 95% organic

424 *The substance should be:* Prohibited (do not add to National List)  
425

426 In a product labeled “made with organic (specified ingredients)”

427 *The substances should be* Allowed without further restriction  
428  
429

430 ***Reviewer 2*** [Ed.D Nutrition Education, Professor Emeritus nutrition and education, many publications, journal reviewer, Eastern US]

431  
432 ***Comments on Database***

433 I find the database (Characterization and Status) to be reasonably complete and fairly accurate.  
434

435 *NOSB Processing Criteria Evaluation*

- 436  
437 1. *It cannot be produced from a natural source and has no organic ingredients as substitutes.*

438 This material IS from a natural source. Therefore (see below).  
439

440 *The criteria evaluation needs to be corrected or amended as follows:*

441 I think the criterion should be restated to read "Is either produced from a natural source or cannot be produced from such  
442 a source and has no organic ingredients as substitutes." If it were worded that way, I would have had something to check.  
443

- 444 2. *Its manufacture, use, and disposal do not have adverse effects on the environment and are done in a manner compatible with organic handling as*  
445 *described in section 6513 of the OFPA.*

446 I agree with the criteria evaluation  
447

- 448 3. *If the nutritional quality of the food is maintained and the material itself or its breakdown products do not have adverse effects on human health as*  
449 *defined by applicable Federal regulations.*

450 *The criteria evaluation needs to be corrected or amended as follows:*  
451

452 Once again the wording is confusing because it's an if-then sentence without a then: "If the nutritional quality. . . etc, "  
453 then what? Don't you mean. "It does not degrade the nutritional quality of the food. . ." or "It maintains the nutritional  
454 quality of the food. . ."  
455

456 4. *Its primary purpose is not as a preservative or used only to recreate/improve flavors, colors, textures, or nutritive value lost during processing except in the*  
457 *latter case as required by law.*  
458

459 The primary purpose of shellac where NOSB is concerned is as an ingredient in sprays or dips designed to keep produce  
460 fresh longer. This would fit my definition of a preservative. (the pharmaceutical uses are not relevant here) Although the  
461 1999 TAP review said that "fruit waxes are generally not considered to be preservatives," it goes on to say (#6) that "these  
462 are non-food materials. . . being applied to food products in order to replace natural oils or waxes. . . or to otherwise  
463 preserve produce in its harvested state for a longer than natural period of time."  
464

465 The criterion also says a material's primary purpose cannot be as a preservative OR to "recreate. . . colors, textures. . . lost  
466 during processing." This is surely a substance designed to replace something (a texture?) lost during processing  
467

468 5. *Is Generally Recognized As Safe (GRAS) by FDA when used in accordance with Good Manufacturing Practices (GMP), and contains no residues of*  
469 *heavy metals or other contaminants in excess of FDA tolerances.*  
470

471 The petitioner's file implies that the substance is GRAS. It is apparently not GRAS because of insufficient data on health  
472 effects  
473

474 6. *Its use is compatible with the principles of organic handling.*  
475

476 . . . Regarding formulation, this specific form of shellac appears to be "natural" in its production. It is, however, applied to fruit  
477 in mixtures containing 55% to 98% other materials. It is unclear from the information provided whether there are enough  
478 allowed materials available to formulate a "natural" fruit coating from a "natural" shellac. If not, the acceptance of this material  
479 may be moot.  
480

481 If such a coating can be formulated, is its application on organic fruit compatible with organic handling? I think not for several  
482 reasons. As described under criterion #4 above, the petitioned material clearly seems intended to serve one or more prohibited  
483 purposes, and in that sense be designed to compensate for deficiencies in handling fruit after harvest. To allow restoration--  
484 with shellac--of the waxy coating naturally present on citrus reduces the motivation to develop a method of cleaning citrus that  
485 does not remove its natural protective wax layer and thus retains its organic integrity.  
486

487 As the 1999 review suggests, the preservative action of fruit waxes is not necessary for a sustainable agricultural system and  
488 may well encourage less sustainable systems involving long distance transport of agricultural commodities  
489

490 Finally, I am very uncomfortable with the idea of "waxing" fruit, not least because consumers have long viewed waxed fruits  
491 and vegetables as a symbol of how far from real food the marketplace has gone. Organic fresh fruits and vegetables are  
492 believed to be free from "processing." If consumers were fully informed by labeling when "organic" fruit was "shellacked,"  
493 they might be somewhat reassured about their ability to get what they are paying for, but this seems like a slippery slope.  
494

495 Since I have myself frequently use citrus peel as an ingredient, it is clear that the proposed material is both a preservative  
496 and an ingredient.  
497

498 7. *There is no other way to produce a similar product without its use and it is used in the minimum quantity required to achieve the process.*  
499

500 There are a number of ways to protect fruit freshness including various controlled atmosphere regimens. There are also a  
501 number of ways to produce fruit coatings, and the literature suggests that where fruits are concerned, some of these are  
502 better for the intended purpose of maintaining fruit quality than shellac based coatings.  
503

#### 504 **Conclusion:**

505 See 4, 6, & 7 above  
506

#### 507 **Reviewer 2 Recommendation Advised to the NOSB:**

  
508

509 The substance is: Not Synthetic, and Non-Agricultural  
510

511 In a product labeled 95% organic

512 The substance should be Prohibited (do not add to National List)

513  
514 In a product labeled “made with organic (specified ingredients)”  
515 The substances should be : Allowed only with additional restrictions (annotation)  
516 Suggested annotation: Allowed only when labeled to indicate that a shellac coating has been added  
517  
518

519 **Reviewer #3** [Ph.D. in food science and nutrition, minor in analytical chemistry. Scientific and technical consultant to  
520 the food, pharmaceutical, and supplement industries. Western US]  
521

### 522 **Comments on Database**

523 *I find the database (Characterization and Status) to be reasonably complete and fairly accurate, with the following addition.*  
524 One concern: This petition is specific to fruit coating only, but shellac is used as a confectionery coating as well. Is  
525 there any additional information as to its use in confectionery? If not, it seems like the annotation needs to be specific  
526 for fruit coating or we need to review it for other uses from the outset. See annotation below.  
527

### 528 **NOSB Processing Criteria Evaluation**

- 529
- 530 1. *It cannot be produced from a natural source and has no organic ingredients as substitutes.*  
531 I agree with the criteria evaluation  
532
  - 533 2. *Its manufacture, use, and disposal do not have adverse effects on the environment and are done in a manner compatible with organic handling*  
534 *as described in section 6513 of the OFPA.*  
535 I agree with the criteria evaluation.  
536
  - 537 3. *If the nutritional quality of the food is maintained and the material itself or its breakdown products do not have adverse effects on human*  
538 *health as defined by applicable Federal regulations.*  
539 *Additional supporting information or comments.*  
540  
541 [Note added ] references regarding allergenic potential. (Hausen, 2001; Orton, D.I. et al. 2001)  
542  
543
  - 544 4. *Its primary purpose is not as a preservative or used only to recreate/improve flavors, colors, textures, or nutritive value lost during processing*  
545 *except in the latter case as required by law.*  
546 I agree with the criteria evaluation  
547
  - 548 5. *Is Generally Recognized As Safe (GRAS) by FDA when used in accordance with Good Manufacturing Practices (GMP), and contains no*  
549 *residues of heavy metals or other contaminants in excess of FDA tolerances.*  
550 I agree with the criteria evaluation.  
551
  - 552 6. *Its use is compatible with the principles of organic handling.*  
553 I agree with the criteria evaluation  
554
  - 555 7. *There is no other way to produce a similar product without its use and it is used in the minimum quantity required to achieve the process.*  
556 I agree with the criteria evaluation. [Reviewer 3 supplied an additional reference, Bai 2001, which compared use of  
557 candelilla wax, carnauba-shellac, shellac, and polyethylene formulations on different varieties of apples. Shellac was  
558 more suited for Red Delicious, but less useful on lighter colored varieties. Candelilla wax did not give as shiny a  
559 coating, and did not cause anaerobic breakdown]  
560

### 561 **Conclusion – Summarize why this material should be allowed or prohibited for use in organic systems.**

562 This material on the whole seems to be compatible with organic production. However, I agree with the comments  
563 that it would be better for the consumer if there were a requirement for labeling of the fruit at retail somehow,  
564 especially with the two incidences that may indicate that there is allergenic potential.(Hausen, 2001; Orton 2001)  
565

### 566 **Reviewer 3 Recommendation Advised to the NOSB:**

567 *The substance is:* Not Synthetic, and is Non-Agricultural  
568  
569 In a product labeled 95% organic  
570 *The substance should be* Allowed only with restrictions (annotation)  
571 Suggested annotation: “for coating of fruit only”  
572 In a product labeled “made with organic (specified ingredients)”  
573 *The substances should be:* Allowed without further restriction

## Conclusion:

The TAP reviewers found that orange unbleached shellac is derived from natural sources, though one considered that the materials used in manufacturing rendered the substance synthetic and not compatible with organic standards. A second reviewer found that the uses of the material to extend shelf life, reduce water loss, and improve cosmetic appeal are not compatible with organic principles. The third reviewer found the material suitable for organic use, though expressed some concerns that consumers should be informed that products have shellac coatings applied, especially since there are some reports of allergenicity. All reviewers found that shellac could be allowed in a product labeled “made with organic ingredients” though one supports a restriction that the coating use clearly labeled.
