Please consider the following recommendations in regards to the upcoming GMO labeling regulations:

1. ALL GMOs must be labeled without excluding newer GMO technologies. This includes oils, sugars and sugar derivatives, highly processed soy and corn products derived from GMO seeds.
2. ALL GMOs must be labeled clearly, in writing, honestly, **with a health warning**. We request the following for the current GMOs on the market:

**Warning: This product contains genetically modified organisms which have been shown to produce toxins and stimulate tumor growth in animals. Many GMOs are engineered to withstand pesticides which do not dry, wash, or cook off. Therefore, this product may contain carcinogenic, neurotoxic, antibiotic, and endocrine disrupting chemicals which cause liver disease.**

I request that any GMOs in development such as CRISPR, RNAI, gene editing or new GMOs should undergo extensive, long-term safety testing before being introduced into the market.

3. ALL GMOs in the market must be labeled clearly, in writing, on the package with the above warning in a timely fashion. USDA must meet its deadline of proposing and then finalizing rules by July 29, 2018. Furthermore, the time period allowed for companies to comply should be one year and no longer. Companies have known that consumers want GMO labeling for years. In fact, several companies, such as Campbell's, Mars, ConAgra, General Mills, and Kellogg's already label their products, with no increase in the cost of their products.
