

September 28, 2006

Mr. Gino Tosi, Associate Deputy Administrator
USDA/AMS/Dairy Programs
Order Formulation and Enforcement Branch
Stop 0231-Room 2971
1400 Independence Avenue, SW
Washington, DC 20250-0231

Re: Proposal on Make Allowances for Reconvened Hearing

Dear Mr. Tosi,

The 309 dairy producers who are member/owners of Southeast Milk, Inc. (SMI) make this proposal for the Make Allowance Reconvened Hearing. The 309 dairy producers of SMI are regulated in either Florida or Southeast Federal Orders. The basis of this proposal is to leave Class I prices unchanged.

PROPOSAL:

SMI's proposal is to have Class I prices calculated with the same make allowances that are currently used to in the Class III and IV price formulas. SMI believes that Class I prices should not change as the make allowances are adjusted. There is no basis for granting a change to make allowances used to calculate the Class I price.

The following is the proposed language change.

1000.50 (q) (1) (i) Use the weighted average of the 2 most recent NASS U.S. average weekly survey prices announced before the 24th day of the month for computing a protein price and other solids price;

(1) Protein price. The protein price per pound, rounded to the nearest one-hundredth cent, shall be computed as follows:

(i) Compute a weighted average of the amounts described in paragraphs (q)(1)(i)(1)(i) and (ii) of this section:

(1) The U.S. average NASS survey price for 40-lb. block cheese reported by the Department for the month; and

(2) The U.S. average NASS survey price for 500-pound barrel cheddar cheese (38 percent moisture) reported by the Department for the month plus 3 cents;

(ii) Subtract 16.5 cents from the price computed pursuant to paragraph (q)(1)(i)(1) of this section and multiply the result by 1.383;

(iii) Add to the amount computed pursuant to paragraph (q)(1)(i)(1)(ii) of this section an amount computed as follows:

(1) Subtract 16.5 cents from the price computed pursuant to paragraph (q)(1)(i)(1) of this section and multiply the result by 1.572;

(2) Subtract 0.9 times the butterfat price computed pursuant to paragraph (l) of this section from the amount computed pursuant to paragraph (q)(1)(i)(1)(iii) of this section; and

(3) Multiply the amount computed pursuant to paragraph (q)(1)(i)(1)(iii)(2) of this section by 1.17.

1000.50 (q) (1) (ii) Multiply the protein price computed in paragraph (q) (1) (i) (1) of this section by 3.1;

1000.50 (q) (1) (iii); Other solids price. The other solids price per pound, rounded to the nearest one-hundredth cent, shall be the U.S. average NASS dry whey survey price reported by the Department for the month minus 15.9 cents, with the result multiplied by 1.03.

(1) Multiply the other solids price per pound computed in paragraph (q)(1)(i)(2) by 5.9; and

1000.50 (q) (1) (iv) Add the amounts computed in paragraphs (q) (1) (ii) and (q) (1) (iii) (1).

1000.50 (q) (2) An advanced Class IV skim milk price per hundredweight, rounded to the nearest cent, shall be computed as follows:

- (i) Use the weighted average of the 2 most recent NASS U.S. average weekly survey prices announced before the 24th day of the month for computing a nonfat solids price; and
- (ii) Nonfat solids price. The nonfat solids price per pound, rounded to the nearest one-hundredth cent, shall be the U.S. average NASS nonfat dry milk survey price reported by the Department for the month less 14 cents and multiplying the result by .99.
- (iii) Multiply the nonfat solids price computed in paragraph (q) (2) (ii) if this section by 9.

JUSTIFICATION:

There is no justification to lower Class I prices which increased make allowances will do. Class I processors have the ability to pass along increased processing and packaging costs through higher wholesale and retail prices. Class I processors can and do make the adjustment to higher processing costs through the pricing of the finished product. For example, SMI operates two fluid milk processing plants. In the pricing formulas set up to announce the monthly price changes, the plants have the ability to pass along any increase in resin, caps, plant energy costs and other related costs. Attached is exhibit 'A' highlighting the average retail price for whole milk and the Class I price mover. This shows that processors have been able recoup their additional costs in bottling fluid milk. Adjusting the Class I price with the make allowance adjustment will allow the processors and retailers an opportunity for windfall profits, all at the expense of the dairy producer.

Lowering Class I prices while making changes to the make allowances that lowers the Class II, III and IV prices will negatively affect producers' income in the Southeast region of the United States, where the milk supply is already deficit. Class I utilization in the Florida Federal Order averages over 82% throughout the year. Therefore the Class I price accounts for the majority of the producers' pay price in Florida. Annually the Class I mover accounts for about 65% of the dairy farmer pay price. To erode producer income in an area already short in milk supply, will cause more producers to exit the business in this geographic region of the country.

In the Southeast Federal Order, the dairy industry struggles to maintain a local supply of milk to meet the consumers' fluid milk needs. Since 1990 to 2004, milk production decreased from 16.2 billions pounds to 11.7 billion pounds, a 28% decrease, while in that same period US milk production grew over 15% to 170.8 billion pounds annually. Alabama, Arkansas, and Louisiana, which are part of the Southeast Order, cannot produce enough milk to supply even 50% of the consumers' Class I needs.

Florida's population from 1990 to 2000 grew almost 24% according the US Census Bureau. With the projected increase in Florida's population in the year 2030 at 80% growth from 2000, it will be very difficult for local milk production to keep up with consumer consumption of fluid milk. Georgia is expecting a growth in population of 47% from year 2000 to 2030. In fact the Southeast region and Florida have been one of the fastest growing areas in population in the US. Attached is Exhibit 'B' – copy of the US Census Bureau's Interim Projections: Ranking of Census 2000 and Projected 2030 State Population and Change: 2000 to 2030.

It is vital to the Southeast dairy industry to keep dairy producers income levels high enough to sustain and grow local milk production to supply the growing local consumer base. As noted in the USDA/AMS website under Federal Milk Marketing Orders, on the benefits of the milk marketing order program is "*Assures consumers of an adequate supply of milk to meet their needs throughout the year and help prevent wild fluctuations in price through periods of heavy and light milk production.*" SMI believes that having a strong base of local production is critical in assuring the consumers of an adequate supply. This base of local milk production will allow consumers to have a supply available in cases of extreme emergencies. These extreme emergencies consist of hurricanes and pandemics. Florida and SMI experienced the four hurricanes of 2004 and experienced difficulties in getting import milk into the state for several days after the hurricanes. Hurricane Katrina washed out major interstate roads and disrupted fuel supplies for trucks with shortages and high prices, making it difficult to move any product long distances. Local state governments have stated when the Avian Bird Flu does break out in US, movement of commercial vehicles between regions can and will be halted. The World Health Organization and numerous branches of the US Government have stated that a pandemic is a matter of when the breakout occurs and not if it occurs. If Class I prices are lowered because of make allowances and local production continues to decrease, consumers in the Southeast will not have adequate supplies of milk available, especially in emergency situations.

The most common response from dairy industry analysts, as a way to offset the lowering of Class prices because of adjusting make allowances is to raise over order premiums. The Florida and Southeast Federal Orders do maintain a reasonable level of over order premiums. Currently, over order premiums are at relatively high level. Processors may push back on premiums if higher levels are sought. Therefore any loss in the Class I price will cause lost income for producers.

Producers in the Upper Midwest, who are shipping their milk to Class III and IV plants, have incurred the price reductions that would be associated with adjusting the make allowances. In comparing the Minnesota and Wisconsin mail box prices to Upper Midwest Federal Order statistical uniform prices for 2003, 2004, and 2005, producers in this order lost about \$.70/cwt.

	<u>MN & WI Mail Box</u>	<u>Upper Midwest Blend Price</u>	<u>Difference</u>
2003	\$12.65	\$10.93	\$1.72
2004	\$16.43	\$14.75	\$1.68
2005	\$15.24	\$14.28	\$0.96

Source: Dairy Market News and Federal Order Statistical Information

These producers have already carried the burden of the increased costs in converting milk into butter, powder and cheese. So changes in the make allowances will not significantly impact their pay prices. The only producers who will take the brunt of the changing make allowances, will be the producers who service the Class I markets.

SMI and its member/owners thank you for the opportunity to submit this proposal.

Sincerely,

Thomas Pittman
Director of Milk Accounting & Economic Analysis
